

SEEWEB CLOUD OBJECT STORAGE

Redundant data storage for your files

What is Cloud Object Storage?

A Cloud Object Storage is a distributed and redundant file hosting system that allows you to store and retrieve files in a simple, efficient, and economical way.

Main software to use with it:

- **Cyberduck**
- **Filezilla**
- **S3**
- **Veeam Backup & Replication**

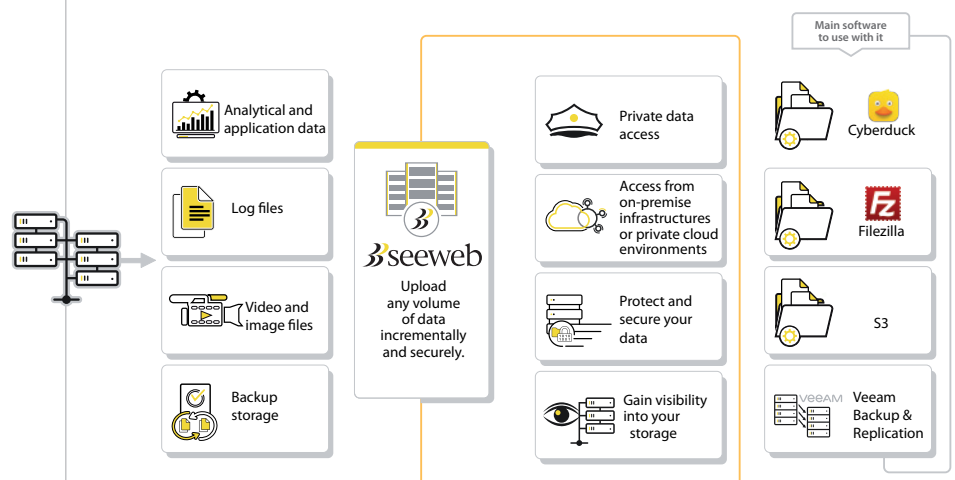

Seeweb Cloud Object Storage

Seeweb Cloud Object Storage service allows you to **store, archive, and share** large amounts of data on the Cloud in a secure, simple, and fast manner. It can be used as a tool to realize **secure backups** of on-premise business storage: all companies with storage systems at their own CED can thus protect themselves from potential security issues.

With Cloud Object Storage, it is possible to access data stored from **on-premise** infrastructures or **private cloud** environments.

Our service is offered starting from a **minimum of 1TB of space** at competitive costs: it is ideal for companies that need to securely manage high data volumes and require guarantees in terms of **uptime** and **compliance**.

The file storage solution of Seeweb is delivered from **our Data Centers based in Italy**, ensuring particular reliability and confidentiality to companies. The product scalability allows the storage system to be automatically adjusted to your real space volume needs.
